iOS 6 is down, and you can update your iPhone, iPad, or iPod touch right now if you want. The following is a list of supported devices and how to install the upgrade. Note: iOS 6 is currently released so it's not available to everyone right now. Be patient and he'll come. Also, be aware that everyone is flooding Apple's servers for updating, so things may be moving a little on the slow side. Step one: Make sure your iDevice is compatible To run iOS 6, you'll need one of the following devices: Of course, iOS 6 runs on the new iPhone 5 and iPod touch (5th generation), but these devices are preinstalled and therefore don't require an upgrade. If you have any of the devices listed above, go to the next step to upgrade. Step two: Upgrade by air or through iTunes There are two ways to update to iOS 6: using iDevice or your computer. I'll see you both. G/O Media can get a commission To update your iDevice in the air, follow these steps: Connect your iPhone, iPad, or iPod touch to power. You don't want the update to stop partly inside because you're out of battery. Back up your device! Open the Settings app. Tap the General tab. Tap the Software Update tab. Wait for your device to check for updates. When it detects an available update, install it. Wait for the update to be downloaded and installed. Don't do anything with your phone while it's doing it. To update iDevice with iTunes on your PC, follow these steps: Connect your iPhone, iPad, or iPod touch to your Mac or Windows PC and open iTunes (if it doesn't open automatically). Backing up your device! iTunes can tell you that an update (iOS 6) is available for your device. If it does, confirm that you want to install it. If not, click your device in the iTunes sidebar and press the Check for updates button. When an update is found, verify that you want to install it. Wait for the update to download, and when it is complete, verify that you want to install it. Wait for the update to install. Regardless of the method you selected, your device will restart after the update is complete. You'll probably need to go through a few setup tables to get started, but your device now has iOS 6! Few things come as handy as a compass and rarely can you find one when needed. Compus is a simple compass application to find your bearings on the go. A clean compass in your pocket, though too simplistic. While each comes equipped with a standard compass application, its accuracy is far from ideal. Compus is an alternative iOS compass application. It uses your phone's magnetometer to determine its orientation in real time relative to the Earth's magnetic field. The application is extremely simplistic, to the point of being rather bare bones. With no options to talk to or settings to customize, Compus is as basic as a compass gets. You can see your current coordinates and cardinal orientation. You can also specify the angle that the current orientation forms with the actual North. The angle is expressed in standard degrees. Degrees, other corner units are offered. Compus is free to download, supported by ads that interrupt the compass every few minutes. Adding insult to injury, many of them do not have a visible exit button. These leave you no choice but to exit the app or click on the ad. Where can you run this program? Compus should work seamlessly on any iOS 7 device (or later) equipped with a magnetometer. It's also compatible with Retina monitors on your iPhone 4. Is there a better alternative? Yes. If you need a more features-rich compass application, you have Altimeter GPS Pro, which also measures altitude and other variables. For a simple compass to navigate, Commander Compass has extremely useful map overlays. Compus isn't the worst compass app you can find, but it's more limited than most compass apps on the market. It's just an improvement over the built-in compass iPhone app. While convenient in a tweak, the user experience around ads is very frustrating. Should I download it? Not. Compus lacks any options or special features while having ads that disrupt normal usage. The built-in compass is quite maintainable as it is. Apple first got the wrappers from iOS 13 back in June at its annual developer conference. The update arrived in September, followed by some updates that added new features and fixed errors. And now, from the end of October, we're up to iOS 13.2. In terms of bringing new features, iOS 13.2 is nowhere near as important as the original iOS 13 was. Still, there are a bunch of new features in this release. If you have one of the new iPhone 11 models, iOS 13.2 adds support for Deep Fusion photography and its more detailed images. There's support for the just-announced AirPods Pro headset, and now you can opt out of Siri recording your requests. If that sounds like something you want now, it's time to install iOS 13.2. How to install iOS 13.2 from iTunes Syncing you need to connect your phone and create a backup anyway when installing a major iOS update, I've always just found it easier to run the installation through iTunes — at least on Macs that still run that app. (iTunes is not part of macOS Catalina; instead, if you've upgraded to macOS Catalina, use Finder to update your iPhone OS.) 1. With your iPhone connected to your computer, start iTunes.2. Click the iPhone icon near the top of the app window to on the screen where you can manage your device.3.
